1. Abstract

This project presents a Power BI business intelligence dashboard for GoldVista, designed to transform sales and transaction data into an interactive management reporting solution. The project focuses on revenue, gold weight, invoices, branches, divisions, karat categories, payment modes, salespersons, customers, discounts, making charges, returns and old-gold buy-back activity. The workflow involved preparing the available business data, organizing analytical fields and measures, and developing a six-page Power BI dashboard that supports both executive-level monitoring and detailed operational analysis.

The Executive Summary reports total revenue of approximately 352.56M, total invoice volume of about 62K, total weight of approximately 2.62M g, an average invoice value of about 5.67K and a return rate of 1.72% as displayed in the dashboard. The remaining pages provide focused views of branch performance, payment and salesperson activity, sales by item and product characteristics, customer intelligence, and returns and buy-back performance. Overall, the dashboard provides a single analytical environment for identifying business trends, comparing branches and salespersons, understanding customer behavior, and monitoring operational indicators.

2. Introduction

2.1 Background

Retail jewelry businesses generate large volumes of transactional information across branches, products, customers, salespersons, payment methods and after-sales activities. A structured business intelligence dashboard can convert these records into information that is easier to monitor and act upon. GoldVista was selected as the project context to demonstrate how Power BI can be used to build an integrated analytical view of jewelry sales and related business activities.

2.2 Problem Statement

Raw transactional data is difficult to interpret quickly when management needs to compare branches, monitor sales trends, understand customer behavior, analyze payment collections, or investigate returns and buy-back activity. The project therefore addresses the need for a consolidated, interactive dashboard that presents key performance indicators and detailed analytical views in a clear format.

2.3 Objectives

- Develop an interactive Power BI dashboard for GoldVista sales and business analysis.
- Monitor key performance indicators such as revenue, invoice count, gold weight, average invoice value and return rate.
- Compare branch performance and identify high- and low-performing areas.
- Analyze payment modes and salesperson performance.
- Understand sales by item type, karat, discounts and making charges.
- Analyze customer acquisition, repeat behavior and customer value indicators.
- Monitor returns and old-gold buy-back activity.

2.4 Scope

The project covers descriptive and diagnostic analysis of the available GoldVista business data. It includes sales, branch, salesperson, payment, product, customer, return and old-gold buy-back perspectives represented in the six dashboard pages. Predictive modelling, automated forecasting and real-time data streaming are outside the current scope.

3. Background Study

Business intelligence combines data preparation, analytical calculations and visualization to support evidence-based decision making. In a retail environment, dashboards are particularly useful because management needs to monitor several dimensions simultaneously: sales value, transaction volume, product mix, customer behavior, branch performance and operational exceptions.

3.1 Power BI in Business Analytics

Microsoft Power BI provides tools for importing data, transforming and modelling information, creating calculated measures, and presenting interactive visual reports. Its filtering and cross-highlighting capabilities allow users to move from a high-level KPI view to more detailed branch, product, customer or transaction analysis.

3.2 Analytical Concepts Used

- KPI analysis for high-level business performance monitoring.
- Time-series analysis for monthly and daily sales trends.
- Comparative analysis for branches and salespersons.
- Segmentation by division, karat, item type and customer category.
- Contribution analysis for payment modes and product groups.
- Return and buy-back monitoring as operational indicators.

4. Data / Materials

4.1 Data Source

The project uses the GoldVista business dataset supplied for the analytics exercise. The dataset was used as the underlying source for the Power BI report. The exact original file name and source location should be entered here if required by the course: [Enter dataset file name / source].

4.2 Data Description

From the completed dashboard pages, the analytical model contains business fields relating to dates, branches, karat, divisions, item types, salespersons, payment modes, customers, discounts, making charges, returns and old-gold buy-back transactions.

Analytical Area	Examples of information represented
Sales	Revenue, invoice count, transaction value, sales trends
Branch	Branch-wise revenue, weight, ranking and comparisons
Product	Item type, karat, division and product contribution
Salesperson	Revenue, transaction activity, ranking and discounts
Payment	Cash, MADA, card/payment-mode collections and trends
Customer	Customer count, new/returning behavior, lifetime value
Returns	Return rate, return value, return trends and return by branch/item
Old Gold	Buy-back volume, value and branch-level buy-back activity

4.3 Key Dashboard-Level Metrics

Metric	Value shown in dashboard	Interpretation
Total Revenue	352.56M	Overall sales value represented in the Executive Summary
Total Invoices	62K	Approximate number of invoices/transactions
Total Weight	2.62M g	Total gold weight represented
Average Invoice Value	5.67K	Average value per invoice
Return Rate	1.72%	Share of transactions/value represented by the return KPI
Old Gold Buy-Back Volume	143.75K	Buy-back volume shown on the Executive Summary

Top Salesperson Revenue	24.05M	Highest salesperson revenue shown on the Payment & Salesperson page
Cash Collection	211.23M	Cash collection shown on the payment analysis page
MADA Collection	92.73M	MADA collection shown on the payment analysis page
Repeat Customer Rate	16.55%	Repeat-customer rate shown on Customer Intelligence
Total Customers	46K	Customer count shown on Customer Intelligence

5. Data Cleaning and Preparation

Before visualization, business data needs to be made consistent so that calculations and comparisons are reliable. The project workflow included preparation of fields required for Power BI analysis. The exact transformation steps should be aligned with the final Power Query steps used in the submitted PBIX file.

- Reviewed the available columns and identified fields required for sales, branch, product, customer, payment, salesperson, return and buy-back analysis.
- Checked date fields and prepared them for time-based analysis such as monthly and daily trends.
- Standardized categorical values such as branch names, karat values, item types and payment modes where required.
- Checked numerical fields such as revenue, weight, transaction values, discounts and making charges so they could be aggregated correctly.
- Reviewed missing or inconsistent values and handled them according to the analytical requirement.
- Created/used Power BI measures and calculated values required for KPIs and comparisons.
- Validated dashboard totals against the values displayed in the completed report pages.

5.1 Data Quality Considerations

For the final academic submission, the detailed Power Query transformations, data types and missing-value rules can be added from the PBIX model if the instructor requires a technical data-cleaning log.

6. Methodology

The project followed a structured business analytics workflow:

- Understand the business context and define the analytical questions.
- Load the GoldVista dataset into the Power BI environment.
- Inspect and prepare the data for analysis.
- Create the required relationships, fields and analytical measures.
- Develop KPI cards and interactive visuals.
- Organize the visuals into six focused dashboard pages.
- Apply slicers and filters for branch, date, karat and other relevant dimensions.
- Validate totals, trends and comparisons shown in the dashboards.
- Interpret the results and convert them into business findings.

6.1 Tools Used

Tool	Purpose
Microsoft Power BI	Data modelling, measures, interactive dashboards and visual analytics
Power Query	Data transformation and preparation within Power BI
Excel / source data	Original business data environment where applicable
SQL	Querying, extracting and preparing raw business data from the database before importing it into Power BI for modelling and analysis

6.2 Dashboard Design Approach

The dashboard was organized from high-level management monitoring to focused operational analysis. This structure makes it possible to start with overall business KPIs and then move into branch performance, payments and salespersons, product-level sales, customers, and returns/buy-back.

7. Dashboard Implementation

Six Power BI pages were completed for the GoldVista project. The screenshots below are taken from the supplied dashboard collage and are included as report figures. If higher-resolution screenshots are available, they can replace these figures before final submission.

7.1 Executive Summary

The Executive Summary provides the management-level view of GoldVista performance. It includes revenue, total weight, return rate, invoice count, average invoice value and old-gold buy-back volume, together with branch, division, karat and time-based visuals.

Key dashboard observation: The page shows total revenue of 352.56M, total weight of 2.62M g, 62K invoices, an average invoice value of 5.67K, a 1.72% return rate and old-gold buy-back volume of 143.75K. The page is designed to provide a quick overview before users move into detailed analysis.

Figure 7.1: Executive Summary dashboard.

7.2 Branch Performance Scorecard

The Branch Performance page focuses on branch-level comparison. It includes branch selection, selected branch revenue, branch weight, branch ranking, payment mix, salesperson ranking, revenue trend and karat mix by branch.

Key dashboard observation: The selected branch view shows revenue of 352.56M and weight of 2.62M g in the supplied screenshot, with a branch rank of 1. The page supports comparison of branch-level sales and product mix and provides a bridge between executive KPIs and operational performance.

Figure 7.2: Branch Performance Scorecard dashboard.

7.3 Payment & Salesperson Analysis

This page analyses how sales are collected and how salespersons contribute to revenue. It includes payment-mode split, payment by branch, payment-mode trend, salesperson revenue, discounts and salesperson ranking.

Key dashboard observation: The dashboard shows top salesperson revenue of 24.05M, average transactions per salesperson of 395.87, cash collection of 211.23M and MADA collection of 92.73M. These indicators help management understand both collection composition and salesperson contribution.

Figure 7.3: Payment & Salesperson Analysis dashboard.

7.4 Sales Deep-Dive

The Sales Deep-Dive page provides detailed product and transaction analysis. It includes bottom-10 items, monthly revenue by item type, item type selection, item type versus karat matrix, discounts and making-charge analysis.

Key dashboard observation: The page helps identify which item types and karat categories contribute to sales and which products may require closer attention. The bottom-10 visual is particularly useful for identifying lower-contributing items, while discount and making-charge visuals provide additional commercial context.

Figure 7.4: Sales Deep-Dive dashboard.

7.5 Customer Intelligence

The Customer Intelligence page focuses on customer composition, repeat behaviour and customer value. It includes customer count, repeat-customer rate, average customer lifetime value, new versus repeat revenue, customer segmentation, purchase frequency and cohort retention analysis.

Key dashboard observation: The dashboard shows 46K total customers, a repeat customer rate of 16.55%, average customer lifetime value of 7.73K, 38K new customers and 8K returning customers. It also shows that 83.45% of customers are categorized as one-time customers in the supplied view, highlighting the importance of retention analysis.

Figure 7.5: Customer Intelligence dashboard.

7.6 Returns & Buy-Back Analysis

The final page focuses on returns and old-gold buy-back activity. It includes return-rate KPIs, old-gold volume and value, buy-back trends, buy-back by branch, returns by branch, return trends, returns by item/karat and buy-back purity distribution.

Key dashboard observation: The dashboard shows a return rate of 1.72% and old-gold volume of 143.75K. The page allows management to monitor return behavior over time, compare branches, and understand the relationship between returns, item types and buy-back activity.

Figure 7.6: Returns & Buy-Back Analysis dashboard.

8. Results and Discussion

The completed six-page dashboard provides an integrated view of GoldVista business performance. The results below are based on the values and visual patterns visible in the supplied screenshots.

8.1 Overall Sales Performance

- Total revenue is displayed as 352.56M, providing the primary scale indicator for the business.
- The dashboard reports approximately 62K invoices and 2.62M g of total weight.
- Average invoice value is displayed as 5.67K, helping contextualize transaction size.
- The Executive Summary combines time, branch, division and karat views so that revenue can be interpreted from multiple perspectives.

8.2 Branch and Salesperson Performance

- Branch-level analysis provides ranking and comparative views instead of relying only on total revenue.
- The Payment & Salesperson page identifies a top salesperson revenue of 24.05M.
- Salesperson ranking and discount analysis can be used to investigate differences in performance and commercial activity.

8.3 Product and Karat Analysis

- Karat-based visuals allow the business to compare 18K, 21K, 22K, 24K and silver categories represented in the dashboard.
- Item-type analysis helps identify the products contributing to monthly revenue and the lower-contributing items shown in the bottom-10 analysis.
- Discount and making-charge analysis add commercial context to product performance.

8.4 Customer Behavior

- The dashboard reports 46K customers and a 16.55% repeat-customer rate.
- The displayed customer segmentation shows 38K new customers and 8K returning customers.
- The one-time customer share shown is 83.45%, indicating that customer retention is an important area for further analysis and business action.
- Average customer lifetime value is shown as 7.73K.

8.5 Returns and Buy-Back

- The overall return-rate KPI is 1.72% in the Executive Summary and Returns page.
- Old-gold buy-back volume is shown as 143.75K in the Executive Summary.
- Branch and item-level return visuals help identify where returns are concentrated.
- Buy-back trend and purity distribution provide an additional view of old-gold activity.

8.6 Business Interpretation

The main value of the dashboard is not a single KPI but the ability to connect different business dimensions. Management can start with total revenue and invoice activity, compare branches and salespersons, inspect product and karat contribution, understand customer retention, and finally investigate returns and buy-back activity. This creates a practical decision-support workflow from summary to detail.

9. Conclusion

The GoldVista project successfully demonstrates how Power BI can convert business transaction data into an interactive management dashboard. Six analytical pages were developed covering executive performance, branches, payments and salespersons, sales deep-dive, customers, and returns/buy-back. The resulting dashboard provides a consolidated view of revenue, transaction volume, product mix, customer behavior and operational indicators. The project objectives were achieved by creating a structured and interactive reporting environment that supports descriptive and comparative business analysis.

10. Future Scope

- Connect the dashboard to a regularly refreshed database or cloud data source.
- Introduce automated scheduled refresh and management alerts for unusual changes in revenue, returns or branch performance.
- Add predictive sales forecasting by branch, product category and month.
- Develop customer churn or retention-risk scoring using historical purchase behavior.
- Create profitability analysis by item, branch and salesperson by incorporating cost information.
- Add more detailed drill-through pages for individual customers, invoices and products where appropriate.
- Integrate real-time or near-real-time operational reporting if the business requires it.
